

NON SURGICAL FACIAL REJUVINATION WITH BOTOX & FILLERS

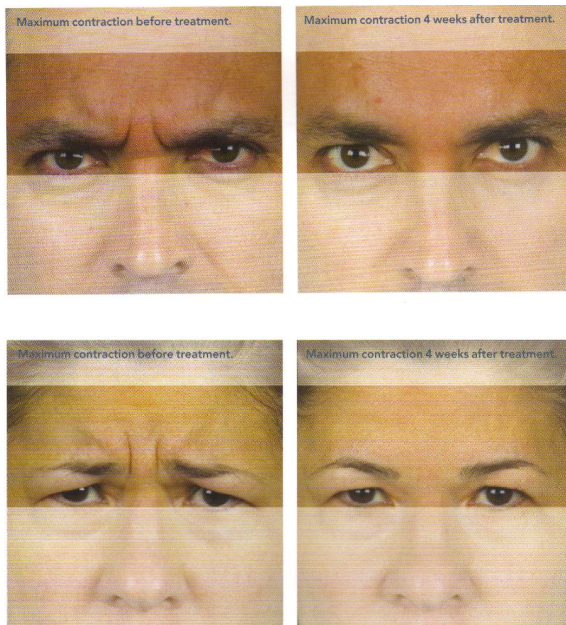

Dermal fillers are injectable substances that can be used to restore facial contours. The products are made from different materials and can be permanent or semi permanent. The main ingredient is Hyaluronic Acid, which is often produced synthetically. Hyaluronic acid is a natural body component and does not cause any allergic reaction. The effects are temporary and last for about 9 to 12 months. The aim of the treatment is to restore the facial contours especially the areas such as the cheeks and nasolabial region. The popular application is to define and augment the lips. The effect is instant with minimal side effects. Other applications are, to restore minor contour deformities in the nose, chin or other areas of face, and to improve the quality of the sun damaged skin.

Botulinm toxin A is a purified protein derived from a bacterium Clostridium botulinum. When injected into a muscle it temporarily blocks the nerve transmission between the nerve and the muscle fibers causing paralysis. Botulinm toxin products can be injected selectively in to the facial muscles to reduce the wrinkles by causing temporary paralysis. The dynamic muscles in the upper part of the face such as forehead lines, glabella lines and wrinkles around the eyes can be successfully treated with Botox. The results are visible about a week after the treatment, and lasts for about 4 - 6 months. Repeat injections are necessary to maintain the results. The lower face and neck can also be treated selectively or in combination with dermal fillers to achieve good results. Specific use of Botox is for the distressing condition called hyperhydrosis causing excessive sweating. Treatment with Botox helps to keep the condition under control usually up to 8 months.
